SKILLS SUMMARY

- **Languages:** Java, Python, JavaScript, JSP, SQL
- **Frameworks:** SpringBoot, Spring MVC, , Hibernate, JDBC, RestApi, Thymeleaf, Numpy, Pandas, FastAPI, React, Django
- **Tools:** PostgreSQL, MySQL, MongoDB, Postman, Git, Docker
- **Others:** REST API, JSON, JWT, Microservice
- **Soft Skills:** Team Work, People Management, Flexibility

EXPERIENCE

View Certificate

Whatbytes/ *Python Backend Engineer* *(Present)*

Cleopatra Project (AI-Driven Engagement Platform)

- Core backend for a donor engagement platform, managing meeting scheduling and integrating secure API endpoints for external email tracking across funder/organization accounts.
- Pioneered the automated ingestion of meeting data via tldv webhooks, processing over 750 meetings each week, leading to a 60% quicker availability of conversational insights for key stakeholders.
- Developed an **AI-powered** predictive model that analyzed data from the last two meetings and emails to generate contextual summaries and automatically suggest funder progression (e.g., move to next stage).
- Optimized performance by solving high-latency issues associated with AI inference; utilized a multi-layered caching strategy (database flag + in-memory) to prevent redundant summarization, reducing average AI response time by over 70%.

KraftWorkSolar Project (Solar Management)

- Engineered a two-way Google Sheet synchronization service using Python/Django, guaranteeing real-time data consistency between customer-submitted data and the relational database (MySQL/PostgreSQL), cutting data discrepancies by 25%.
- Automated the feedback loop by implementing a scheduled Celery background task that ran monthly, ensuring targeted email reminders were sent exclusively to users who had not completed the feedback form, significantly boosting response rates.

Ardvark Network Solutions Private Limited / *Java Backend Engineer* *March 2024 – June 2024*

- Backend microservices using **Java** and **Spring Boot** for the "Telecom Salesforce Management Platform", *enhancing system scalability* and *reducing average API response times by 15%.*
- Refactored complex **SQL** queries to streamline data retrieval workflows, cutting average query execution time under peak load by *30 seconds* and improving team access to critical data.
- Enhanced system stability by implementing *effective load balancing* and refining *API integration protocols* in **Java** microservices, resulting in a *20%* decrease in runtime errors during high-traffic periods.
- Created comprehensive unit tests using **JUnit and Mockito** for critical Java microservice components, achieving *85%* code coverage and significantly reducing the occurrence of regression bugs.
- Designed and implemented normalized relational database schemas in **MySQL** for the customer profile module, ensuring data integrity across *7* tables and supporting efficient data querying.

PROJECTS

E-commerce Platform **/** ***React, Thymeleaf, SQL*** **View on GitHub**

- Developed a full-stack e-commerce platform utilizing **Spring Boot** and **Thymeleaf**, delivering *4* core features including product Browse, shopping cart management, and secure user authentication, enhancing user engagement capabilities.
- Interactive front-end modules ensuring seamless data exchange with the **Spring Boot** backend via REST APIs, delivering robust features with *sub-200ms* rendering performance to a daily user base.
- Optimized performance of complex SQL queries through refactoring, resulting in a 20% improvement in data access speed for critical operations.

EDUCATION

Tezpur University Tezpur, Assam

- *Master of Computer Applications; CGPA:* ***7.1*** *November 2022 - June 2024*
